THREE END-TO-END BUILDS, STEP BY STEP

Sales Agent *Workflows*

Three builds, each step by step: what triggers it, what every agent does, where a person checks, how to roll it out and what to measure. The first two are based on systems I built at UXCam. The third runs my own website.

WORKFLOW

The inbound agent

Reply to every lead in minutes, with people approving until it earns the right to send alone.

I built this at UXCam with HubSpot and Claude Code, with Apollo, Lusha and LinkedIn Sales Navigator for enrichment: several agents in one flow, one enriching, one scoring fit from the profile, one writing the message, with every lead and drafted reply posted to a Slack channel for feedback and approval. First reply went from about a day to 5 minutes.

TRIGGER → ENRICHMENT AGENT → SCORING AGENT → WRITING AGENT → QUALITY CHECK → APPROVAL IN SLACK → SEND AND LOG → HOT LEAD ALERT → LEARN

The stack

CRM and trigger	HubSpot form submission
Enrichment	Apollo, Lusha and LinkedIn Sales Navigator
Agents	Claude, orchestrated with Claude Code
Approval	A Slack channel: feedback and approve to send
Booking	Your calendar link

Step by step

STEP	WHAT HAPPENS	OUTPUT
1. Trigger	A form is submitted in HubSpot. The workflow passes the contact and form answers to the orchestrator.	Contact ID, form answers, page and source
2. Enrichment agent	Researches the company and person: size, funding, what they sell, tech, hiring, recent news. Every fact keeps its source.	Enrichment record with sources
3. Scoring agent	Scores fit from 1 to 5 against your written ICP, with a one-line reason and the facts behind it.	Fit score, reason, evidence
4. Writing agent	Drafts the reply in your best rep's voice from their real examples, using prompt 02 from the Prompt Pack. Returns JSON with the facts it used.	Subject, body, facts used, confidence
5. Quality check	A separate check: every fact must be in the enrichment, no banned phrases, length and tone in range. Fails go back to the writer once, then to a person.	Pass or fail, with reasons
6. Approval in Slack	Every lead lands in one Slack channel as it comes in: whether it qualifies, the details that matter, and the reply already drafted. The team gives feedback right on the message and approves to send. All feedback stays in that one channel.	Decision and feedback, in one place
7. Send and log	The approved reply is sent from the rep's mailbox. Everything is logged on the HubSpot contact: score, reason, draft, decision.	Sent email, CRM timeline
8. Hot lead alert	Fit 4 or 5 alerts an SDR to call straight away, with the brief in the message.	Slack alert with call brief
9. Learn	Every edit and rejection is saved with its reason. Once a week, the best edits become new examples for the writer.	Better examples, rising approve rate

Roll it out, then measure it

Shadow

Two weeks. The agent drafts for every lead. Nobody sees it. A person writes as usual, and you compare.

Approve

Every draft goes to Slack. Measure "approved without edits" by segment.

Automate

A segment sends on its own once 95% are approved without edits over at least [200] leads.

Audit

One in twenty sent replies is still reviewed. If quality drops, that segment goes back to approval.

Measure

- Time to first reply
- Approved without edits, by segment
- Reply and meeting rate
- Inbound to sales-qualified rate
- Cost per lead processed

Avoid

- Starting with automation instead of approval. The approval data is what tells you when it's ready.
- One agent doing everything. Separate steps are easier to test and fix.
- No reason on rejections. Without the reason, you can't teach it.

WORKFLOW

The outbound signal engine

Find the companies where you make the biggest difference, then test the message by person, company and timing.

I built this at UXCam with Clay and Claude Code, using app store data to find companies where the product could make a big difference. A largely automated engine hitting about 500 accounts and 4,000 contacts a month, with Lemlist warming up the sending addresses.

DEFINE THE SIGNAL → BUILD THE ACCOUNT LIST → FIND THE PEOPLE → RESEARCH AGENT → WRITING AGENT → CHECK AND APPROVE → SEND SAFELY → TEST → FEED BACK

The stack

Data and enrichment	Clay, plus the public data your ICP shows up in
Research and writing	Claude, orchestrated with Claude Code
Sending	Separate warmed-up sending domains
CRM	Every touch logged

Step by step

STEP	WHAT HAPPENS	OUTPUT
1. Define the signal	From your ICP work (prompt 01), pick the public signals that predict fit. For a mobile product that can be app store data: number of apps, ratings, update rate.	Two or three testable signals
2. Build the account list	Pull every company that matches, enrich them, and score them on the signals. Keep the score and why.	Scored account list
3. Find the people	For each account, the two or three roles that feel the problem and the one that signs.	Contacts by persona
4. Research agent	Writes a short "why now" per account from the signals and news, with sources.	Account brief with sources
5. Writing agent	Writes a short sequence per persona, using the brief. Every claim must come from the brief.	Sequence per persona
6. Check and approve	A person reviews a sample from every batch before it sends, using the same "would I send this" test.	Approved batch
7. Send safely	Use separate sending domains, warm them up first, keep volumes low per inbox, and stop on bounces.	Healthy deliverability
8. Test	Change one thing at a time: the persona, the company type, or the timing. Track replies and meetings, not opens.	What works, by segment
9. Feed back	Positive replies and meetings sharpen the signals and the ICP. Bad-fit replies become "say no" rules.	Better list each round

Roll it out, then measure it

Small batch

Start with 50 accounts you know well, so you can judge the research.

First run

Scale to your first full list once the briefs are right and replies come in.

Iterate

Weekly tests on persona, company and timing. Results build over months, not days.

Scale

Add volume only to the segments that work.

Measure

- Positive reply rate by segment
- Meetings booked per 100 accounts
- Bounce and spam rates per inbox
- Pipeline created by signal

Avoid

- Sending from your main domain.
- Scaling before you know which segment works.
- Writing "personalised" lines from facts nobody checked.

WORKFLOW

A lead engine for a small business, on free tools

The one that runs this website: a free scorecard that sends a report from your own inbox and logs every lead.

This is the system behind the scorecard on harryjamescoburn.com, built in October 2026 on free tiers.

THE OFFER → CAPTURE → SEND FROM YOUR OWN INBOX → LOG THE LEAD → BOOK → REVIEW WEEKLY

The stack

Lead magnet	An interactive scorecard on the website
Email	A Google Apps Script that sends from your own Gmail
CRM	HubSpot free
Booking	Cal.com, synced to HubSpot

Step by step

STEP	WHAT HAPPENS	OUTPUT
1. The offer	A two-minute scorecard: ten taps, a score, three first moves. Useful on its own, with a fuller report by email.	A reason to leave an email
2. Capture	The visitor asks for the report, with clear consent for the report and occasional follow-up.	Name, email, answers, consent
3. Send from your own inbox	A small Apps Script rebuilds the report from the answers and sends it from your Gmail. Your domain already signs Gmail, so it lands in the inbox, not spam.	Report delivered, copy to you
4. Log the lead	The same script records the contact and their scores in HubSpot.	A CRM record with the report
5. Book	Every report has a booking link. Cal.com creates the contact and meeting in HubSpot.	Meeting on the record
6. Review weekly	Once a week, look at visits, completions, reports and bookings, and change one thing.	One improvement a week

Roll it out, then measure it

Build

One afternoon.

Test

Send yourself a report from the live site.

Promote

Link it from LinkedIn posts and your email signature, with UTM tags.

Improve

Change one thing a week, based on completions.

Measure

- Scorecard completions
- Report requests
- Calls booked
- Where they came from

Avoid

- Sending from a CRM's servers on a free plan, which often lands in spam.
- Asking for too much before giving anything useful.
- No consent wording.

WANT THESE BUILT INTO YOUR ENGINE?

Trained on your data, checked *to your standard.*

In a Commercial Systems Build I set up agents like these on your own deals, calls and CRM, and only switch them on once they send what your best people would send.

Book an intro call: cal.com/harryjamescoburn/intro
Score your sales engine: harryjamescoburn.com/scorecard
Email: harry@harryjamescoburn.com

THESE ARE STARTING POINTS. TEST EVERY PROMPT, WORKFLOW AND SKILL ON YOUR OWN DATA BEFORE YOU TRUST IT.
